

# Download Female Reproductive Health

The female reproductive system is made up of the internal and external sex organs that function in reproduction of new offspring. In the human the female reproductive system is immature at birth and develops to maturity at puberty to be able to produce gametes, and to carry a foetus to full term. **Reproduction.** All living things reproduce. Reproduction — the process by which organisms make more organisms like themselves — is one of the things that set living things apart from nonliving matter. **Front view of female reproductive organs.** **Side view of female reproductive organs.** The female reproductive organs include the ovaries, fallopian tubes, uterus and vagina. **Endometriosis** – a condition involving colonization of the abdominal/pelvic cavity with islands of endometrial tissue. Endometrium is the lining layer of the uterus which sloughs off with each menstruation. If endometrial tissue flushes up the uterine tube and spills into ... **Female reproductive system diseases** [Read More](#)
